```
$ cat summary.txt
```

Technical builder with 28+ years in mission-critical network operations who now delivers working software using AI-assisted, spec-driven development. I define the vision and requirements, direct AI coding agents (Kiro) to build in Python, then test and debug until it works. At CPKC I drove a company-wide event-analysis platform ingesting billions of messages/day. My operations depth means I understand the systems these tools serve – and know when the output is right.

```
$ skills --list
```

ai_dev = spec-driven development, requirements, directing AI agents (Kiro), iterative test & debug

ownership = vision → delivery, verifying output vs. real-world requirements

shipped_tech = [React, Supabase/Postgres, Python, Vercel, SQL, Oracle, Git] # AI-directed, see project

foundation = Linux/CLI, log analysis at scale, troubleshooting

systems = Kubernetes, virtualized SMS/MMS, IMS Core

domain = ["Positive Train Control", "telecom ops", "oil & gas"]

```
$ git log --experience
```

Senior PTC Applications Engineer – CPKC

2022 – Present · Remote

- ▶ Own vision + delivery of internal tools for Positive Train Control ops (safety-critical; the tool has to work).
- ▶ Built LocoGrip, a company-wide event-analysis platform (billions of PTC messages/day) – now the primary Event & Incident Analysis tool for 45 users across 5 teams; automates log diagnosis that once took ~1 hour/event.
- ▶ Delivered Python DB-integration tools connecting SQL/Oracle into custom apps & reporting.
- ▶ Spec-driven with Kiro: define requirements → direct AI → test/debug to a working result.

ATS Senior Network Engineer – T-Mobile

Aug 2020 – Aug 2022

- ▶ Product Lead for MCO and Kubernetes-containerized MCO handling SMS/MMS traffic.
- ▶ Migrated Sprint traffic to a new Replica MCO environment; consolidated onto one network.
- ▶ Authored MOPs; trained teams on new products at rollout.

Network Translations Specialist / NTAC Engineer – Sprint

Jul 1998 – Aug 2020

- ▶ Built a virtual SMS/MMS platform (Mavenir, Rackspace); led SMS migration to IMS Core via SIP.
- ▶ Internalized MMS processing (Syniverse → virtualized MMSC), cutting managed-services cost.
- ▶ Saved Sprint \$1.2M over 3 yrs via vendor renegotiation; ran 24/7/365 support.

```

Oil & Gas Well-Tracker Application – React · Supabase · Python # own business, J&T Cook Corporation

Full-stack tracker across 58 wells (48 producing) & 6 operators: investment vs. revenue, payout status, operator-statement ingestion, bank reconciliation, tax reporting. Owned vision + requirements, directed AI to build, debugged to a live production deploy.
