CORE STRENGTHS

AI-Assisted Development

Spec-driven builds, requirements, directing AI agents (Kiro), test & debug to a working result

Product Ownership

Vision → delivery, verifying output against real needs

Shipped Tech (AI-directed)

React, Supabase (Postgres), Python, Vercel, SQL/Oracle, Git

Foundation

Linux/CLI, log analysis at scale, troubleshooting

Systems

Kubernetes, virtualized SMS/MMS, IMS Core

DOMAIN

Positive Train Control & rail

Telecom / network operations

Oil & gas

EDUCATION

B.S. Business Management

Friends University, Wichita, KS

SUMMARY

Technical builder with 28+ years in mission-critical network operations who now delivers working software using AI-assisted, spec-driven development. I define the vision and requirements, direct AI coding agents (Kiro) to build in Python, and stay with the project through testing and debugging until it works. At CPKC I drove a company-wide event-analysis platform ingesting billions of messages/day. A deep operations background means I understand the systems these tools serve.

EXPERIENCE

Senior PTC Applications Engineer — CPKC

2022 – Present · Remote

- Own the vision and delivery of internal tools for Positive Train Control operations — a safety-critical environment where the tool has to work.
- Drove a company-wide event-analysis platform ingesting billions of PTC messages/day for proactive problem isolation, used across all of CPKC.
- Delivered Python database-integration tools connecting SQL and Oracle sources into custom apps and reporting.
- Work spec-driven with Kiro: define requirements and target result, direct the AI, then test and debug to a working tool.

ATS Senior Network Engineer — T-Mobile

Aug 2020 – Aug 2022

- Product Lead for MCO and Kubernetes-containerized MCO handling SMS/MMS traffic.
- Migrated Sprint traffic to a new Replica MCO environment, enabling contract consolidation.
- Authored MOPs and trained teams on new products at rollout.

Network Translations Specialist / NTAC Engineer — Sprint

Jul 1998 – Aug 2020

- Implemented a virtual SMS/MMS messaging platform (Mavenir, Rackspace); led SMS migration to IMS Core via SIP.
- Internalized MMS processing (Syniverse → virtualized MMSC), eliminating managed-services costs.
- Saved Sprint \$1.2M over three years by renegotiating a vendor contract; ran 24/7/365 support.

SELECTED PROJECT

Oil & Gas Well-Tracker Application — React, Supabase, Python (own business, J&T Cook Corporation)

Full-stack app for working-interest tracking across 58 wells (48 producing) and 6 operators: investment vs. revenue, payout status, operator-statement ingestion, bank reconciliation, tax reporting. Owned vision + requirements, directed AI to build, debugged to a live production deploy. github.com/djwilli69/well-tracker-demo
